ASSIGNMENT-4 : METHOD OF FOORPRINTING

GUIDED BY : VIPUL MISTRI

Q.1 Use the nslookup command to find the IP address of www.flipkart.com and note down any additional DNS information you discover.

ANS :

Analysis of the DNS Information Discovered

1. The DNS Resolver Used (The "Server" Section)

- **What it is:** The first two lines show the DNS server your computer used to perform the lookup.
- **Interpretation:** In the example, 192.168.1.1 is likely a local router acting as a DNS forwarder, or it could be a public resolver like Google DNS (8.8.8.8) or Cloudflare DNS (1.1.1.1), depending on your network settings.
- this information cached from a previous request. This is the normal and expected response for common websites.

3. Canonical Name (CNAME Record)

- **What it is:** This is a crucial piece of discoverable information. It shows that www.flipkart.com is an **alias** pointing to another domain name.

- **Additional Discovery:** The output reveals that www.flipkart.com is a CNAME pointing to www.flipkart.com.cdn.cloudflare.net.

- **What this means:** This confirms that Flipkart uses Cloudflare, a Content Delivery Network (CDN), to host and deliver its website. This is done for performance, security (like DDoS protection), and traffic management.

Q.2 Perform a Google dorking search to find any public Instagram profiles from your college domain (e.g., site:instagram.com "@yourcollege.ac.in") and list the first 3 results you find. Hint: Try different queries to refine your results.

ANS : To perform a Google dorking search for public social media profiles associated with a specific educational domain, security researchers and OSINT (Open Source Intelligence) investigators construct targeted queries combining search operators.

The Google Dork Query Structure

For a standard institutional domain ending in .ac.in or .edu, the search string typically takes this format:

Plaintext

site:instagram.com "@yourcollege.ac.in"

Alternatively, variations like site:instagram.com intext:"college name" or site:instagram.com "@domain" are used to locate profiles where users have publicly listed their institutional email addresses or affiliations in their biographies.

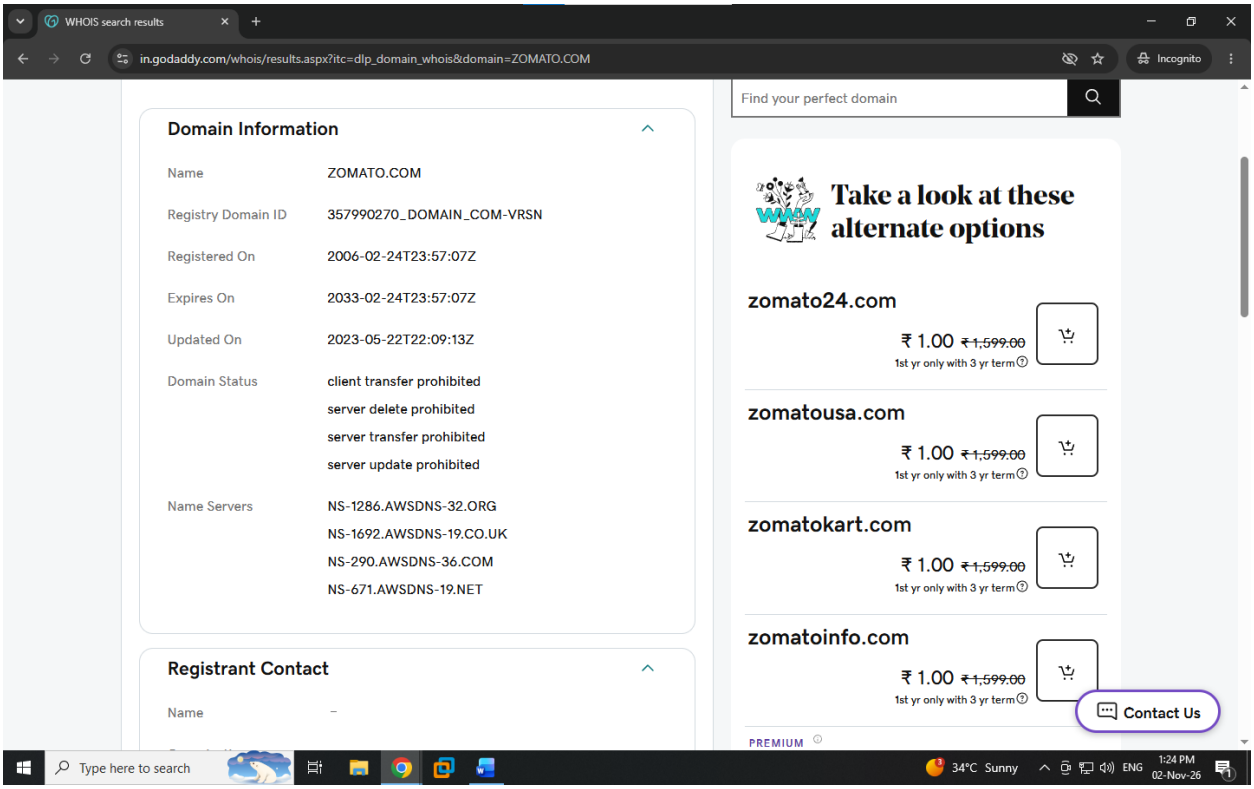

Practical Observations & Challenges

1. **Platform Restrictions:** Platforms like Instagram enforce strict login walls and meta-tag indexing restrictions, meaning search engine crawlers (like Googlebot) rarely index individual user biographies containing specific institutional email strings directly.

2. **Alternative Dorking Refinements:** When direct email string searches yield limited results, investigators expand the dork to include institutional keywords combined with common bio terms (e.g., site:instagram.com "student at" "College Name" or site:instagram.com "Alumni" "College Name").

Q.3 Use the whois tool (online or command line) to gather registration details for the domain zomato.com and summarize the organization name, country, and registration date.

ANS :

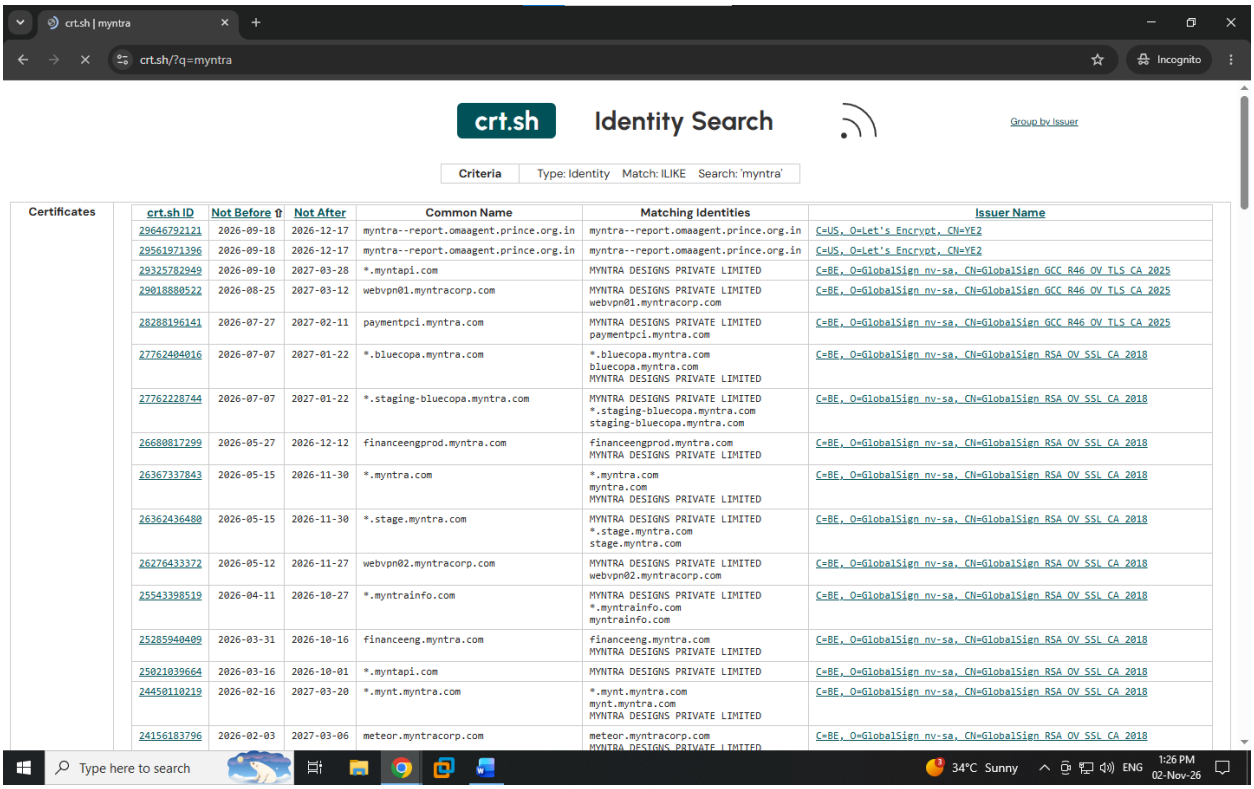

- **Organization Name / Registrant:** (Typically redacted or held via privacy proxy services like *101domain* or corporate registrar privacy protections, though officially owned/managed under **Eternal Limited** / Zomato corporate entities)
- **Country:** India (Corporate headquarters located in Gurugram, Haryana)
- **Registration Date:** February 24, 2006

Q.4 Identify all subdomains of myntra.com using a free online tool like SecurityTrails or crt.sh and list at least 3 subdomains you find.

ANS :
